When an older report gives a more precise number

A risk-limit review using original BlackRock disclosures

GPT-6 High returned the correct exposure, limit decision and supporting source pages in all four original-PDF questions and all four matched text questions. The observed results were identical at a tolerance of 0.005 percentage points and at exact equality to the printed-value references.

What changed from the earlier pilot

Each PDF trial supplied BlackRock Investment Funds' full 510-page annual report for the year ended 28 February 2025 and September 2026 factsheets for the MyMap 3 and MyMap 5 Select ESG funds. The question specified the target ETF, date, account weights and limit. It gave no table locations or instructions on how to interpret missing holdings. The text comparison supplied transcriptions of the relevant portfolio statements and complete top-ten lists with dates and page labels. Each of the eight questions ran as a first turn in a fresh, unpersonalized temporary chat.

Four decisions from one constructed account

The account allocates 40% to MyMap 3 Select ESG and 60% to MyMap 5 Select ESG. The two target USD Treasury bond ETFs differ in maturity. We measured only the directly held long position in the named ETF and used the issuer's printed percentages.

Position date	ETF	Account exposure	Limit	Supported decision
28 Feb 2025	3–7yr	2.078%	2.50%	Within limit
30 Sep 2026	3–7yr	2.068–3.982%	2.50%	Undetermined
30 Sep 2026	7–10yr	9.260%	9.00%	Above limit
30 Sep 2026	3–7yr	2.068–3.982%	4.25%	Within limit

Why the older number matters

The 2025 annual report lists the 3–7yr ETF at 3.68% in MyMap 3 and 1.01% in MyMap 5 (PDF pages 252 and 317). The September 2026 factsheets give a 5.17% weight in MyMap 3 and a 3.19% cutoff in MyMap 5's top ten (page 3 of each, position dates on page 1). A reviewer who carries forward the historical 1.01% would report 2.674% and declare a breach at 2.50%. The original-PDF answer explicitly rejected that calculation. It also correctly identified 0.72% as the MyMap 5 weight above which the limit would be breached.

Interpretation

This test found no loss from giving the product original PDFs in these cases. One issuer, one model configuration, one account, and three distinct exposures make this a feasibility result. The two interval questions reuse the same position. PDF retrieval and layout handling are bundled in this comparison, and the product's internal retrieval is unobserved. The records support a retrospective review of the holdings dates. Availability to the analyst *on* each historical date was not tested.
