A 13F filing over a holiday weekend

GPT-6 High selected the older holdings report on Monday and the newer one on Tuesday. Both source selections and both limit decisions matched the reference. The model identified the holiday and the release date in both conversations. Its wording leaves open which filing timestamp it used.

One filing, two decision times

The simulated account assigned 40% to sleeve A and 60% to sleeve B. Each sleeve had an independently fixed $100 million NAV. A's old and new reports valued X at $4.25 million and $8.50 million. B's public statement valued X at $4.00 million. The new 13F transmission began at 18:05 ET on Friday 13 February 2026 and was accepted at 18:10. Each prompt omitted the release date and holiday label. The only difference was the decision time.

Decision time (ET)	A source	B source	Exposure	5% limit
Mon 16 Feb, 12:00	K41 (old)	M27	4.10%	Within
Tue 17 Feb, 23:59	R86 (new)	M27	5.80%	Over

The two reference exposures are $0.4(4.25) + 0.6(4.00) = 4.10$ and $0.4(8.50) + 0.6(4.00) = 5.80$, in percentage points. Both first responses matched exactly and returned the requested JSON structure.

What the explanations establish

Both replies placed public release on Tuesday and explicitly mentioned Monday's federal closure. Both described the filing as *accepted* after 17:30. The SEC cutoff turns on when transmission *begins*.[1] Since both timestamps fell after the cutoff, the decisions cannot distinguish the two interpretations. The 2026 EDGAR calendar lists Monday 16 February as a closure.[2] The Tuesday cutoff falls after the stipulated close of dissemination, so the reference needs no assumption about the exact morning release minute.

Scope and provenance

Prompts, scoring rules and reference answers were hashed at 22:06:51 UTC, before either submission. Each item used a fresh temporary chat with GPT-6 High, Tuesday first, with no visible tool use. This is one paired synthetic case, scored separately from the earlier pilot. The Gemini series remains incomplete, with no Gemini answers to this pair. The packet preserves first replies, computations and the assistant's explanation checks.
